### \*DEVICE COMMUNICATION

**Bi-directional Connectivity** – In this two-way communication, the data manager can upload data to the device in addition to reading data from it. For devices that feature bi-directional capability, RALS can upload a wide range of data including lists of valid operators, reagent lot information (lot #, ranges, etc.) and device configuration information.

**Uni-directional Connectivity** – In this one-way communication, the data manager can only read information from the device and cannot upload information to the device.
